

Building **Production Ready** AI Solutions

TEAM MEETING · MAY 2026

THE CLIENT PROBLEM CHANGED

The work evolved.
The **positioning** caught up.

BEFORE

Product Dev + Rescue

BUILD THE APP → FIX THE SYSTEM → RESCUE THE PROJECT → SHIP THE MVP

NOW

Production **AI Systems**

CONNECT THE SYSTEMS → STRUCTURE THE CONTEXT → AUTOMATE THE WORKFLOW → DEPLOY THE AGENT → OPERATE THE AI SYSTEM

This is not a hard pivot. The reason we can do this work is because we know **production systems**.

THE INDUSTRY IS MOVING HERE

Context Engineering is becoming **the standard**.

G

"Context engineering is the new prompt engineering."

Google I/O · Context-centric agent architecture, Gemini grounding, and enterprise data integration as the core AI strategy.

Anthropic

"The Model Context Protocol makes AI agents useful in the real world."

MCP · Open standard for connecting AI to enterprise systems. Extended thinking and system prompts as the context operating layer.

"AI that understands your business data."

Cortex AI · Enterprise data context as the foundation for reliable AI. Structured retrieval from governed data stores.

SAP

"AI embedded in business processes, not bolted on."

Joule AI · Context from ERP, CRM, and HCM as the differentiator. Business process context is the moat.

The model is commoditized. The **context layer** is the moat.

RESOURCES FOR THE TEAM

How we talk about ECE and production AI.

Production-ready AI positioning

Full offer structure

ECE framework and use cases

WHAT PRODUCTION AI ACTUALLY LOOKS LIKE

The chatbot is 5%. The system is 95%.

ENTERPRISE CONTEXT ENGINEERING

Context. Intelligence. Control.

CONTEXT

What AI can understand

The data, relationships, and business logic AI needs to operate.

- Connected data across your apps
- Role-based access controls
- Business objects and relationships
- Retrieval tuned per workflow

INTELLIGENCE

What AI can execute

The agents, workflows, and actions that produce useful output.

- Agents and multi-step workflows
- Human review checkpoints
- Actions into CRM, email, docs
- Retrieval + reasoning strategies

CONTROL

What makes AI reliable

The evals, feedback, and governance that keep it running.

- Testing and eval cases
- Feedback loops
- Cost and usage visibility
- Security and compliance

THE FOUR NEW AI OFFERS

Production-Ready **AI Systems**

PRODUCTION-READY AI SYSTEMS

FOUNDATION

Enterprise Context Engineering

Build the context layer AI needs. Connect fragmented systems, structure business context, deploy production AI.

IMPLEMENTATION

Agentic Workflows

Automate one repeatable workflow end to end. Ship in 4–6 weeks with connected systems and structured context.

AGENTS

Autonomous Agents

Deploy scoped agents inside real tools with guardrails. Built on existing tools and business context with human oversight.

OPERATIONS

AI Operations

Keep production AI reliable after launch. Monitoring, evals, tuning, model upgrades, and incident response.

ECE is the **foundation**. Workflows are the first implementation. Agents are scoped roles. AI Ops keeps it running.

WHAT THIS LOOKS LIKE IN REAL WORK

Same pattern. Different clients.

 Revenue Operations WORKFLOW Lead scoring + proposal generation SYSTEMS HubSpot, Apollo, DarcylQ, Drive OUTPUT ICP scores, proposal drafts, enriched contacts CONTROL ICP review gates, evals at 92%, override learning	 Compliance & Governed AI WORKFLOW Violation triage, CPR ingestion, risk detection SYSTEMS Payroll CPRs, wage determinations, internal platform OUTPUT Risk scores, copilot responses, restitution drafts CONTROL Citation gates, audit trail, cost tracking, HITL review	 Security Awareness WORKFLOW [Fill in] SYSTEMS [Fill in] OUTPUT [Fill in] CONTROL [Fill in]	Big State Home Buyers WORKFLOW [Fill in] SYSTEMS [Fill in] OUTPUT [Fill in] CONTROL [Fill in]	Boondocker WORKFLOW [Fill in] SYSTEMS [Fill in] OUTPUT [Fill in] CONTROL [Fill in]
---	---	---	---	--

WHERE THE CURRENT WORK STILL FITS

An evolution of the work, not a replacement.

WHAT CHANGES IN DELIVERY

When we scope AI work, we ask **different questions.**

- 01** What workflow repeats every week?
- 02** Where does the context live?
- 03** What should the system produce?
- 04** What action is it allowed to take?
- 05** Who reviews or approves it?
- 06** How do we know the output is good?
- 07** What needs to be logged, monitored, and improved?

MetaCTO builds production-ready software and AI systems for companies with messy real-world operations.

We connect the systems, structure the context, and ship
workflows, agents, and products that teams can actually
use.

TRUSTED CONTEXT. USABLE OUTPUTS. RELIABLE ACTIONS.

WHAT TO DO NEXT

For the team

- ✓ **Read** the new homepage, Solutions page, and ECE page.
- ✓ **Bring** one current client workflow that might fit this pattern.
- ✓ **Practice** the new talk track with your own words.
- ✓ **Pick one learning lane** and go deeper.

- Context engineering
- Agents and tools
- RAG and retrieval
- Evals and observability
- AI operations
- Human-in-the-loop systems

Up to \$200 credit for AI learning

Buy and complete a course on any of the listed topics. We'll reimburse up to \$200.

- Udacity
- Coursera
- Google
- LangChain
- Anthropic

Have fun. This is the work getting more interesting.

Q&A WITH CHRIS AND GARRETT
